

## Diagnostics overview: **IT Security Diagnostic Program**

---

Constant firefighting is leaving you one step behind attackers, placing your organization at risk for today's advanced threats.

### **We can help you...**

- Assess current operations based on best practices.
- Measure business satisfaction and identify security needs.
- Gauge trends and identify where to focus security improvements.
- Improve targeted IT Security areas.

#### **Problem**

IT Security is complicated, fast-moving, and difficult to measure, so it often gets ignored by the business and managed reactively by IT.

#### **Risk**

Choosing to remain reactive to security incidents is costing your business beyond just leaving it open to attacks. Operations are delayed, users get frustrated, and leaders lose confidence.

#### **Root Cause**

Taking stock of your situation to identify current vulnerabilities or high-impact areas for improvement is next to impossible in reactive mode. You're too busy dealing with problems to get ahead.

#### **Solution**

Get proactive in managing your IT security strategy! Identify your baseline and start using it as a roadmap to improve. Not only will your organization be more secure, but gaining support from stakeholders will also be easier because of your due diligence.
